

How to Deliver Oodles and Oodles of Current to HEP Detectors in High Radiation and Magnetic Fields?

Satish K Dhawan
Yale University

KEK Seminar
June 14, 2010

1 Oodle = 10,000 amps

Agenda

- ❖ Power efficiency issues / problems CMS-ECAL Example
- ❖ What can we do?
- ❖ A commercial Rad Hard Converter - EN5360 can still buy it
- ❖ Buck Converter
- ❖ Plug in cards with Air Coil
- ❖ Noise Test with Detectors
- ❖ Magnetic Field 7 T – no effect
- ❖ Why need Thin Oxide
- ❖ LDMOS: Radiation Test Results
- ❖ GaN Wide band Gap materials
- ❖ Converters 36V – 1.2V & 48V -1.8
- ❖ Industry Developments & Market Trends
- ❖ Power Supply Current Reduction
- ❖ Remarks

Collaborators:

Yale University: Keith Baker, Hunter Smith

11 Regulators each with Output Current maximum = 2.5 amps

Power Input
4.3 Volt Analog
4.3 Volt Digital

Operating Current = 16 amps

Motherboard for VFE Cards

FE card

Thermistors (Total = 3)

LVR: Low Voltage

CMS ECAL: Electromagnetic Calorimeter
 80 Amps Power supply for 4 LVR Boards
 Power Supply @6.3V 30 meters away
 3K Boards x 16 amps = 48 Kamps
 Magnetic Field 4T in CMS
 Power Delivery Efficiency < 40 %

CMS ECAL: 5 Oodles (50 Kamps) .

Power Supply output = 315 KW
Power loss in Leads to SM = 100 KW
Power loss in Regulator Card = 90 KW
Power Delivered @ 2.5 V = 125 KW

of Power Supplies ~ 700

of ST LDO Chips = 35 K LHC Radiation Hard made by ST Microelectronics

of LVR Cards = 3.1 K.

Yale: Designed, built, burn-in and Tested.

Power Supply
6.3 V

64 Amps

30 m

Vdrop = 2V
Pd = 128 W

2x16 mm² (AWG 6)

1 to 3 m

50 mm² (AWG 00)

SM: Super Module

4.3 V

Junction Box

2.5V

64 amps

160 W

4 LVR Boards

**Power Delivery Efficiency = 40%
NOT INCLUDED**

1. Power Supply efficiency
2. Water cooling
3. Removal of Waste heat
4. Air Conditioning

What can we do?

- Is there a better way to distribute power ?
- High Radiation
- Magnetic Field 4 T
- Load ~1 V Oodles of current
- Feed High Voltage and Convert - *like AC power transmission*
- Commercial Technologies — *No Custom ASIC Chips*
- Learn from Semiconductor Industry
- Use Company Evaluation Boards for testing

Buck Regulator Efficiency after 100 Mrad dosage

Found out at Power Technology conference 0.25 μm Lithography

- Irradiated Stopped on St. Valentines Day 2007
- We reported @ TWEPP 2008 - IHP was foundry for EN5360

Length of Power Cables = 140 Meters

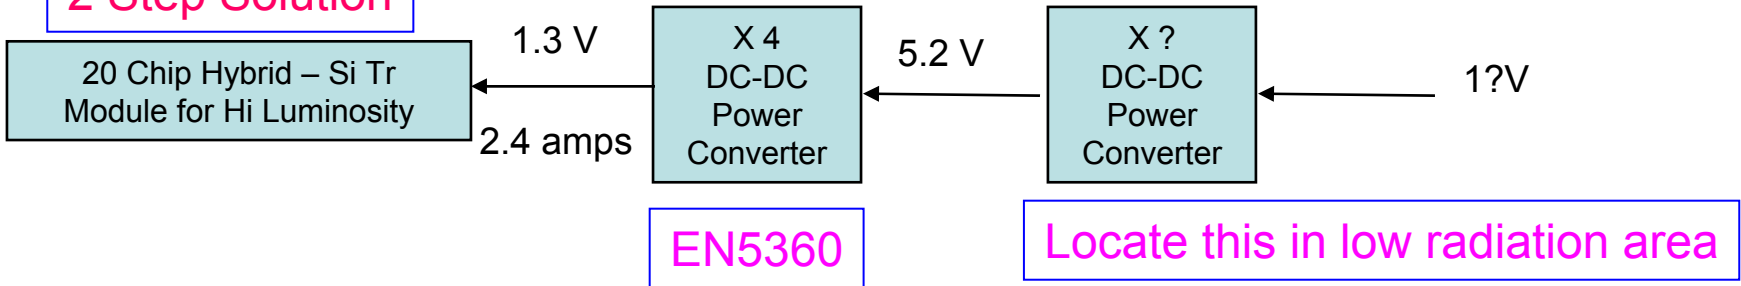

LHC Solution

sLHC Solution

2 Step Solution

Overall Efficiency is product of 2 efficiencies

1 Step Solution Desired

Power Delivery with Existing SCT Cables (total = 4088)

Resistance = 4.5 Ohms

Type of High to Low Voltage Converters without transformers

❖ Charge pumps

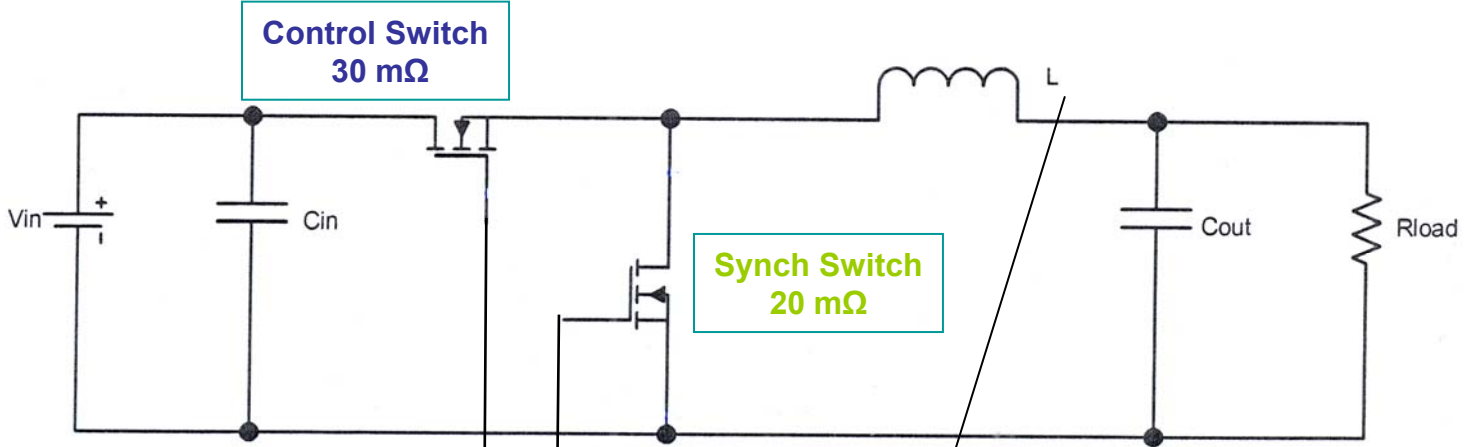

- Normally limited to integral fractions of input voltage
- Losses proportional to switch losses
- Can provide negative voltage

❖ Buck Converter – Used in consumer & Industrial Electronics

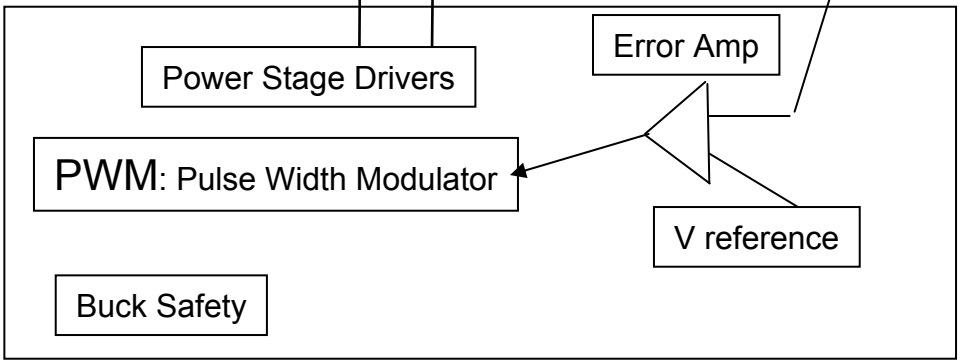

- Needs an ASIC, Inductor and Capacitors
- Cannot provide a negative voltage
- Topology allows for more flexibility in output voltage than charge pump
- Much more common use in commercial applications

Synchronous Buck Converter

Power Stage
- High Volts

Controller
Low Voltage

Minimum Switch ON Time
Limits Max Frequency
10 nsec @ 10 MHz

Lower Voltage Ratio
>>> Higher Frequency
& Smaller Coil

Vout = 11%

Control Switch: Switching Loss > I²
Synch Switch: R_{ds} Loss Significant

Vout = 50%

Coils under Study: Solenoid, Toroid, Spirals

Test @ BNL

Only One Chip Bonded

512 Strips – 100 μ m Pitch
51 mm x 84 mm

Noise Tests with Silicon Sensors

Test @ Liverpool

Plug in Card
1 cm from Coil
facing Sensor

20 μ m Al foil
shielding

Coil Type	Power	Input Noise electrons rms
Solenoid	DC - DC	881
Solenoid	Linear	885
Spiral Coil	DC - DC	666
Spiral Coil	Linear	664

Magnetic Field Effect

7 Tesla Field Chemistry Department
Super Conducting Magnet in
Persistence Mode

Effect:

$V_{out} = 3.545$ Outside

$V_{out} = 3.546$ Edge of magnet

$V_{out} = 3.549$ Center of magnet

Change= Increased V_{out} 1 part in 900 at 7T

Ionizing Radiation Results – Commercial Converters

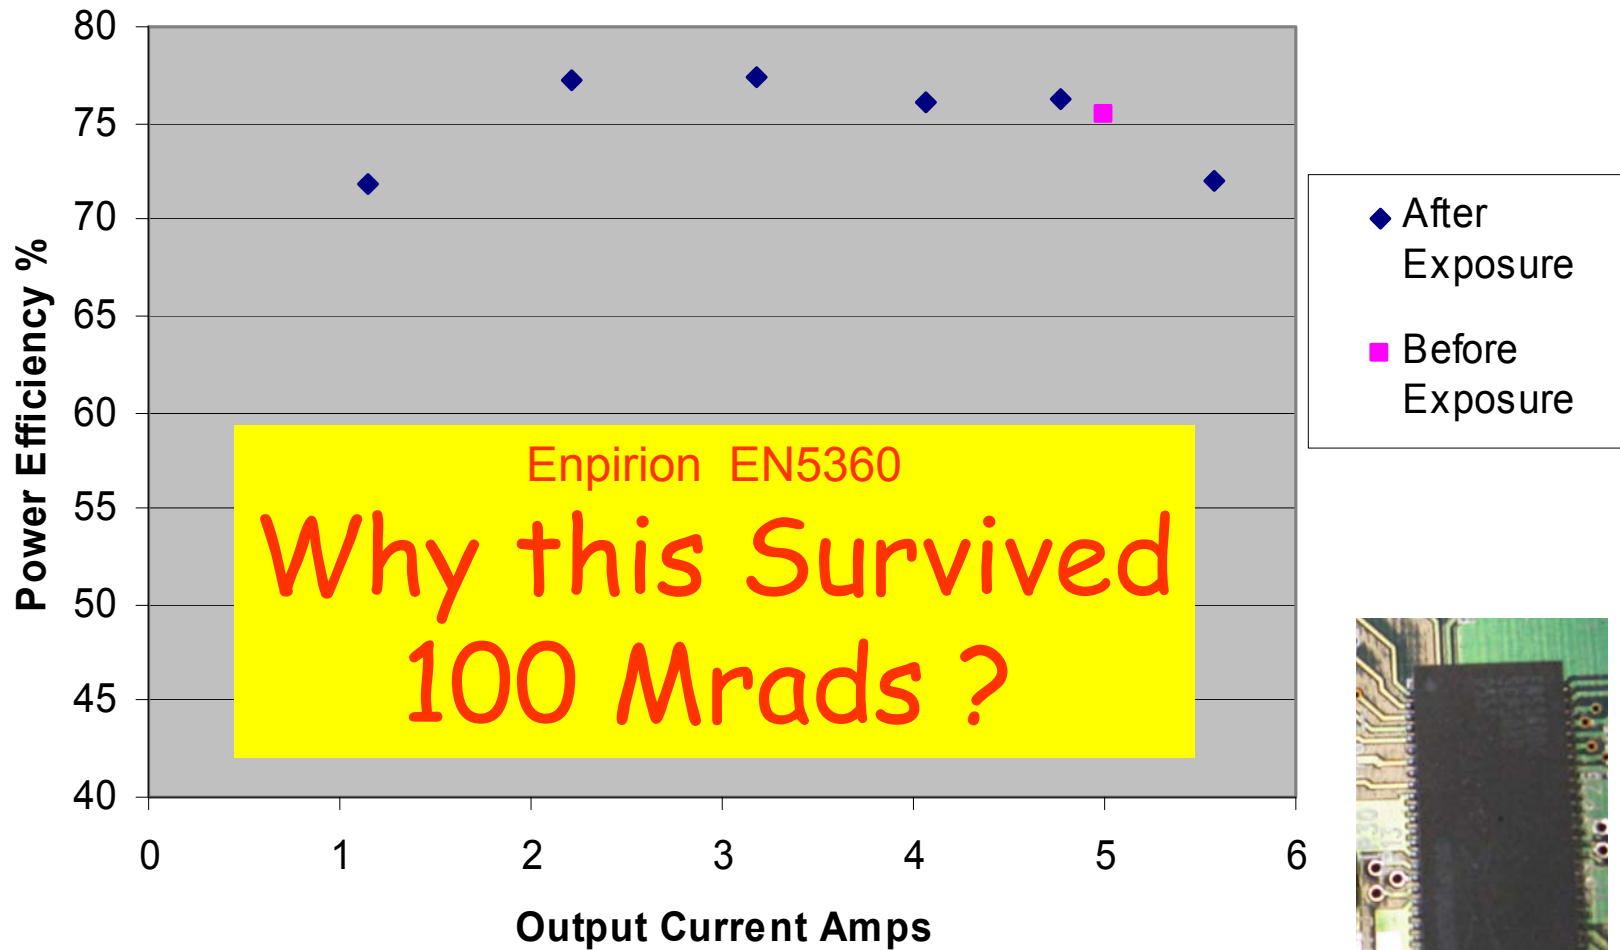

Device	Time in Seconds	Dose before Damage Seen (krads)	Observations Damage Mode
TPS 62110	720	40	Increasing input current
ISL 8502	730	40.6	Increasing input current
MAX 8654	850	47.2	Loss of output voltage regulation
ADP 21xx	1000	55.6	Loss of output voltage regulation
ST1510	2250	125	Loss of output voltage regulation
IR3822	2500	139	Increasing input current
EN5382	2000	111	Loss of output voltage regulation
EN5360 #3	864000 Tested in 2008	48000	MINIMAL DAMAGE
EN5360 #2	Tested in 2007	100000	MINIMAL DAMAGE

Dose rate= 0.2 Mrad/hr

5 nm Oxide DC-DC

Many more tested but similar failure-
Thin oxide converters survive > 200 Krads

Buck Regulator Efficiency after 100 Mrad dosage

What Makes it Rad Resistant ?

Empirical Evidence: Deep submicron
But why?

What Makes it Rad Resistant ?

We say thin Gate Oxide is a necessary Condition

Threshold Shift vs Gate Oxide Thickness

Sachs et. al. IEEE Trans. Nuclear Science NS-31, 1249 (1984)

Book. Timothy R Oldham "Ionizing Radiation Effects in MOS Oxides" 1999 World Scientific

CERN ASICs

Mantra: Deep sub micron is more rad hard

Why ?

IBM Foundry Oxide Thickness			
Lithography	Process	Operating	Oxide
	Name	Voltage	Thickness
			nm
0.25 μm	6SF	2.5	5
		3.3	7
0.13 μm	8RF	1.2 & 1.5	2.2
		2.2 & 3.3	5.2

Can We Have High Radiation Tolerance & Higher Voltage Together ???

Controller : Low Voltage

High Voltage: Switches –

LDMOS, Drain Extension, Deep Diffusion etc

>> 20 Volts HEMT GaN on Silicon, Silicon Carbide, Sapphire

LDMOS Structure
Laterally Diffused
Drain Extension

High Voltage / high Frequency
Main market. Cellular base stations

Fig.1: Schematic cross-section of the RF-LDMOS transistor.

Fig.3a: Potential distribution at the highest operating voltage (20V) with $V_G=0V$ (LDMOS 3 from Table 1).

Fig.3b: Potential distribution at the lowest operating voltage (4V) with $V_G=0V$ (LDMOS 3 from Table 1).

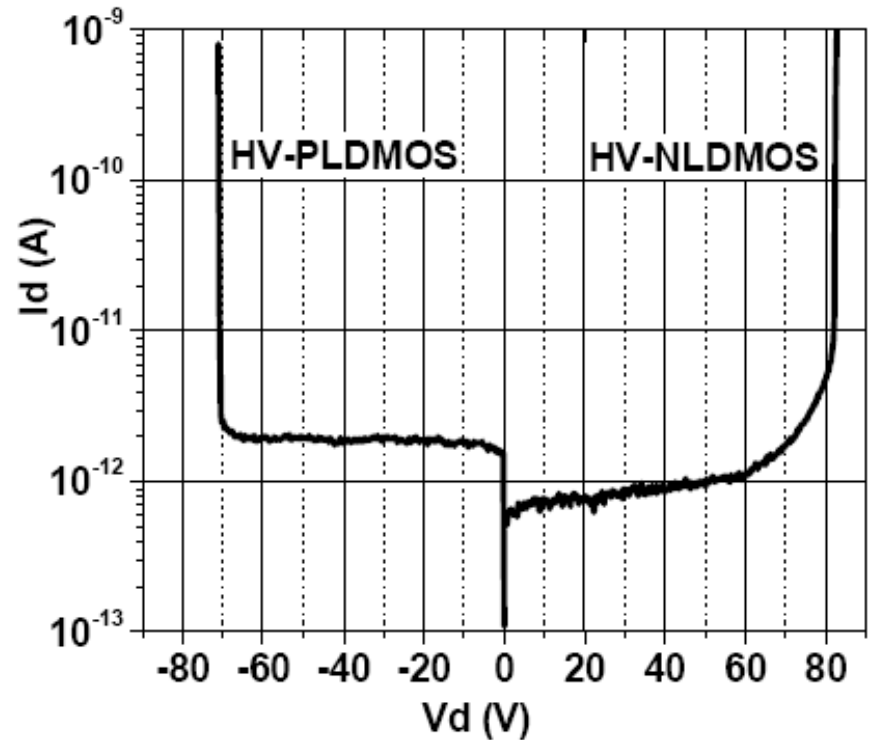

Fig. 7. Break down characteristics of PLDMOS and NLDMOS ($w = 5.6 \mu\text{m}$, $L_d = 3 \mu\text{m}$).

Thin Oxide Devices (non IBM)

Company	Device	Process	Foundry	Oxide	Dose before	Observation
		Name/ Number	Name	nm	Damage seen	Damage Mode
IHP	ASIC custom	SG25V GOD 12 V	IHP, Germany	5		Minimal Damage
XySemi	FET 2 amps	HVMOS20080720 12 V	China	7		Minimal Damage
XySemi	XP2201	HVMOS20080720 15 V	China	12 / 7		1Q2010
Enpirion	EN5365	CMOS 0.25 μ m	Dongbu HiTek, Korea	5	64 Krads	
Enpirion	EN5382	CMOS 0.25 μ m	Dongbu HiTek, Korea	5	111 Krads	
Enpirion	EN5360 #2	SG25V (IHP)	IHP, Germany	5	100 Mrads	Minimal Damage
Enpirion	EN5360 #3	SG25V (IHP)	IHP, Germany	5	48 Mrads	Minimal Damage

Necessary condition for Radiation Hardness - **Thin Gate Oxide**

But not sufficient

IHP: Epi free, High resistivity substrate, Higher voltage, lower noise devices

Dongbu: Epi process on substrate, lower voltage due to hot carriers in gate oxide

XP2201 - 20V 2A STEP-DOWN DC to DC CONVERTER

General Description

Non- Synchronous

Features

- 2A Output Current
- Up to 95% Efficiency
- 4.5V to 20V Input Range
- Adjustable Output Voltage
- Fixed 400KHz Frequency
- Integrated 0.2Ω Switch
- 20uA Shutdown Supply Current
- Internal Soft Start
- Cycle-by-Cycle Over Current Protection
- Thermal Shutdown
- Programmable Under Voltage Lockout
- Operating Temperature: -40°C to +85°C
- Available in an 8-Pin SO Package

Replacement for LHC4913:

LHC Radiation Hard LDO
Made by ST Microelectronics

Use with Ferrite Coil

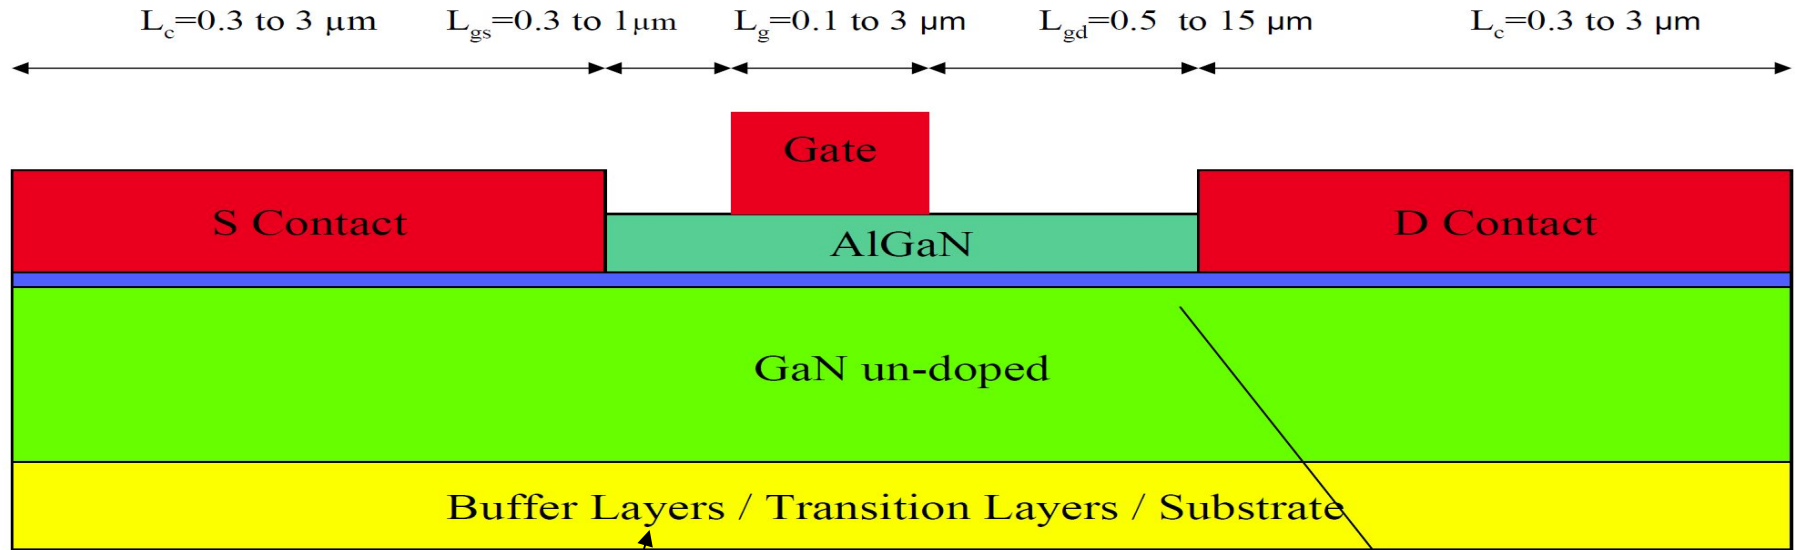

Engineering Samples
1Q2010

GaN HEMTs Why of Interest?

- High voltage and current rating
- Very high switching frequency (> 1 GHz range)
- Depletion mode are radiation Hard (details follow), Enhancement mode devices not yet available. One brand in March 2010

GaN for Power Switching

For Lattice mismatch GaN & Silicon

Piezoelectric effects
create 2 DEG electron
sheet $n_s=10^{13} \text{ cm}^{-2}$

No Gate Oxide
High Dielectric strength
High Thermal conductivity

- Low on-resistance due to high Channel mobility ($1500 \text{ cm}^2/\text{V}\cdot\text{s}$) and sheet electron density ($1 \times 10^{13} \text{ cm}^{-2}$)
- High gate leakage current (reduced by hybrid MOS-HEMT structure)
- Small conduction band offset between AlGaN and GaN

Depletion Mode
Normally ON

- Inversion-mode, normally-off operation
- Blocking voltage controlled by dopants incorporated by epi-growth or ion-implantation
- Low gate leakage current

Enhancement Mode
Normally OFF

Gallium Nitride Devices under Tests

Power Supply Manufacturer Association

Yale University is member

What is happening outside HEP ?

Server Power System Distribution from IBM

1. AC Distribution - 208/230/115V

- o Servers, Blade Servers, Workstations

2. 12V DC Distribution

- o Blade Server Chassis, Low end and Midrange Servers, Workstations

3. 48V Distribution in a Rack

- o High End Server Applications

4. 350V DC Distribution in a Server Rack or a Rectifier Cabinet

- o Main Frame Servers

International Workshop on Power Supply On Chip

Sept 22nd - 24, 2008

Cork, Ireland

Potential LV DC-DC Power Stage Roadmap

Optimized Performance – Without tradeoff

12Vin, 1.2Vout, 100A Based on Circuit Simulation

Is there a Commercial product available ?

Yes = It is the EN5360

- ❖ Satellite folks are using it now
- ❖ sLHC Levels – 100 Mrads
- ❖ Use for voltage ratio = 4
- ❖ Work at Super LHC levels for Tracker
- ❖ 5.5 V in > 1.3 out
- ❖ Enpirion is still supplying these to a very large customer
- ❖ IHP foundry will make it for many years.
- ❖ Can purchase in Die form for use with Air coil

For Purchasing EN5360:

Steve Robb (908) 894 -6083 srobb@enpirion.com

Tom Howell (908) 894-6029 thowell@enpirion.com

CONVERTERS INSTALLED

CERN - Chamonix 2010 Report

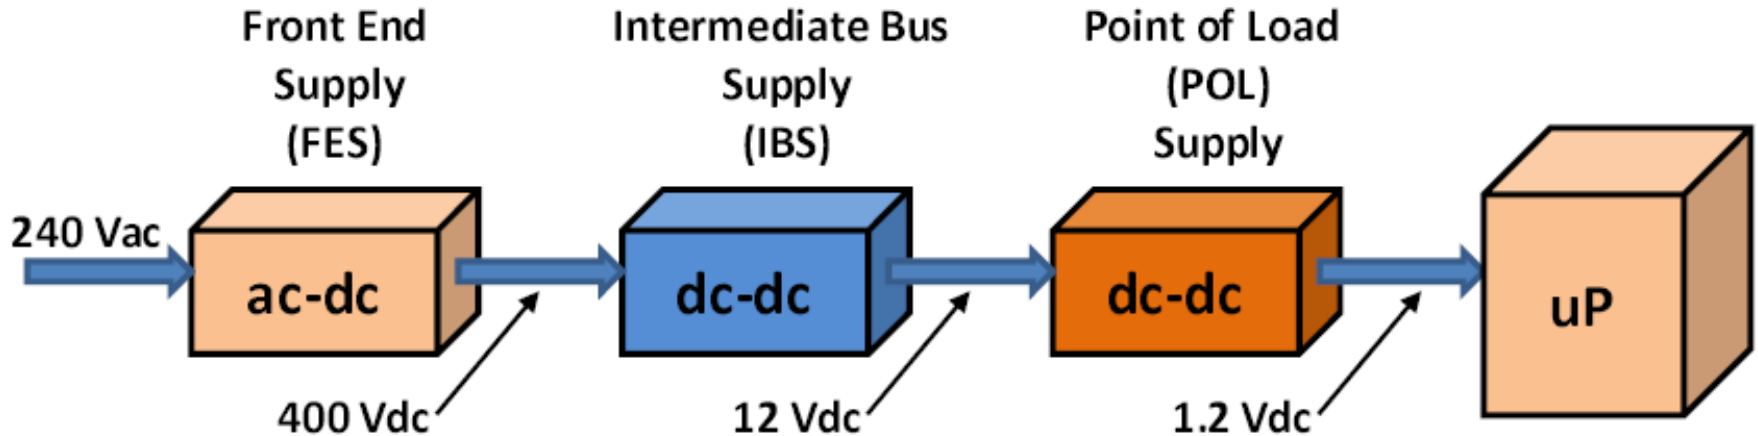

LHC CONVERTERS VS RADIATION [2010]

- Rad Tolerant Design *or* standard Design with low Rad sensitivity (safe components)
- Standard Design *and* Rad sensitivity unknown (too many components, sub-assemblies...)

Radiation Risk ➔

AC - DC Power Efficiency Challenge by IBM September 2007

	FES	IBS	POL	Plug-to-Processor
Recent	93%	95%	88%	78%
Best Immediate	95%	98%	90%	84%
	IBM Challenge			90%
Needed	98%	98%	94%	90%

Conclusions

- The power distribution needs of HEP detectors require new solutions/technologies to meet power and environmental requirements.
- DC/DC (Buck) Converters are potential solutions for these needs.
- The environment requires that these converters operate in high radiation environments and high magnetic fields at high switching frequencies in a small size/mass package.
- Target technologies for the switches are radiation hard GaN and 0.25 μm LDMOS. High frequency controllers driving small sized nonmagnetic/air core inductors are also required.
- Many of these components have been tested and now need integration to produce a working prototype. This is the next step in our R&D program.

What can be achieved by this Development ?

- ❖ Current Reduction from Power Supply by DC-DC near Load
Losses $> \text{Current}^2 \times \text{Resistance}$
- ❖ Silicon $\div 10$ Current Reduction **5 Oodle $>$ 0.5 Oodle**
CMOS converters can run @ Li Nitrogen temperature
- ❖ GaN $\div 50$ Current Reduction **5 Oodle $>$ 0.1 Oodle**
Power Converters for Beam Line usage

Thermal Challenge

A grain of Basmati Rice
4 watts

GaN FETs
40 V 33 A 4m Ω

FET Solder side

Radiation Resistant Power Supplies with GaN ?

- ❖ Materials Journey Se .. Ge...Si...GaN
- ❖ Why Gallium Nitride. Better FOM = $R_{DS(ON)} \times Q_G$
- ❖ Enable new Capabilities ?
- ❖ High Electron Mobility
- ❖ High Frequency – 10 GHz
- ❖ X10 higher dielectric strength
- ❖ Higher Thermal Conductivity
- ❖ Majority Carrier Device – No reverse recovery
- ❖ Cost ?
- ❖ Is it easy to use? Learning curve
- ❖ End of the Silicon near?
- ❖ DC-DC Converters 48V- 1V, 400V- 48V Radiation ?
- ❖ Development 600V, 1200, 5000V

A polar bear stands on a vast, flat expanse of snow and ice. To the left, there is a dark, irregularly shaped hole in the ice. A long, dark shadow of the bear is cast to its left. To the right, a series of tracks leads away from the bear, curving towards the bottom right of the frame. The overall scene is desolate and cold.

Working on Power Supply Is not Glamorous

Top of the World is Cool but lonely!
Let us keep it cool with highly efficient PS
Swimming is Great at the North Pole
